# **GROOVED FOAM BACKED PANELS**

Inventor: Paul R. Pelfrey

## **BACKGROUND AND SUMMARY OF THE INVENTION**

**[0001]** This application incorporates by reference U.S. Patent No. 6,321,500 and presently pending U.S. Patent Application No. 10/447,896, filed on May 29, 2003, as background for the present application.

**[0002]** The present invention relates generally to grooved foam backed panels for building structures. Examples of panels that may benefit from the present invention include siding panels, wall panels, and other similar, suitable, or conventional types of panels. In the event that a liquid, such as condensation or rainwater, was to accumulate or get behind a foamed backed panel of the present invention; the liquid should be allowed to drain away. The present invention provides a drainage pathway for a liquid on a surface of a backing portion of a paneling unit.

**[0003]** In order to enhance the thermal insulation of building structures, it is known to provide one or more layers or panels of insulating material between the vinyl facing panel and the building structure. The backing may also improve the structural characteristics of the siding panel. Known insulated siding systems exist in many different forms. For instance, it is known to nail large sheets of insulating material to the building structure and then install the siding over the insulating material. Another system places a panel of insulation material in a slot behind the vinyl facing panel. Yet

another system pours foam filler into the back of a vinyl facing panel such that the foam filler conforms to the geometry of the vinyl facing panel.

**[0004]** The present invention provides a drainage pathway, comprised of grooves, for a liquid on a surface of a backing portion of a paneling unit. Typical installations of the present invention include paneling units generally installed vertically so that a generally downwardly oriented plurality of drainage grooves allows a liquid to drain. Preferred embodiments of the present invention also comprise connector grooves that intersect at least two of the plurality of drainage grooves. As a result, alternative drainage pathways are provided in the system of preferably hydraulically connected drainage grooves and connector grooves.

**[0005]** In addition, the present invention may provide for an orientation of the grooves on the surface of a backing portion of a paneling unit of the present invention so that adjacent, substantially similar paneling units installed with the paneling unit may have at least a portion of the plurality of drainage grooves to be part of a segment of a continuous drainage groove. In this manner, a liquid may drain from the surfaces of the backing portions of the installed paneling units through an interconnected system of continuous drainage grooves. Additionally, the present invention may provide for at least one connector groove on a surface of a backing portion of a paneling unit to form at least a segment of a continuous connector groove with adjacent, substantially similar installed paneling units. As discussed above, the continuous grooves between adjacent panels may facilitate the drainage of liquid from the surfaces of the backing portions of the installed paneling units.

**[0006]** The present invention is an improvement over each of the aforementioned systems. An exemplary embodiment of the present invention provides a siding unit, which is comprised of backing and a facing panel. The advantages of the backed siding may include improved energy efficiency, reduced air infiltration, reduced curvature in the siding panels, and increased ease of installation. One embodiment of the backed siding of the present invention has improved interlocking pieces and an improved backing. Chemicals may be added to the backing that aid in the reduction or repelling of insects such as carpenter ants and termites.

**[0007]** In addition to the novel features and advantages mentioned above, other features and advantages of the present invention will be readily apparent from the following descriptions of the drawings and exemplary embodiments.

#### BRIEF DESCRIPTION OF THE DRAWINGS

**[0008]** Figure 1 is a side elevation view of an assembly including a first exemplary embodiment of a backed siding unit according to the present invention.

**[0009]** Figure 2 is a side elevation view of the siding unit shown in Figure 1.

**[0010]** Figure 3 is a side elevation view of an assembly including a second exemplary embodiment of a siding unit of the present invention.

**[0011]** Figure 4 is a side elevation view of an assembly including a third exemplary embodiment of a siding unit of the present invention.

**[0012]** Figure 5 is a side elevation view of an exemplary embodiment of a wall panel unit of the present invention.

**[0013]** Figure 6 is a side elevation view of another exemplary embodiment of a wall panel unit of the present invention.

**[0014]** Figure 7 is a side elevation view of an assembly of paneling units of Figure 6.

**[0015]** Figure 8 is a side elevation view of a designated portion of Figure 7.

**[0016]** Figure 9 is a side elevation view of a third exemplary embodiment of a wall panel unit of the present invention.

**[0017]** Figure 10 is a partial side elevation view of an assembly including the paneling units shown in Figure 9.

**[0018]** Figure 11 is a side elevation view of a fourth exemplary embodiment of a wall panel unit of the present invention.

**[0019]** Figure 12 is a rear elevational view of an exemplary embodiment of a paneling unit of the present invention.

**[0020]** Figure 13 is a rear elevational view of a portion of an exemplary embodiment of a paneling unit of the present invention.

**[0021]** Figure 14 is a side elevational view of an exemplary embodiment of a paneling unit of the present invention.

**[0022]** Figure 15 is a side elevational view of a portion of an exemplary embodiment of a paneling unit of the present invention.

## DETAILED DESCRIPTION OF EXEMPLARY EMBODIMENT(S)

**[0023]** The present invention is directed to a backed paneling unit. Figures 1 through 11 illustrate exemplary embodiments of a paneling unit of the present invention. Figures 1 and 2 show a siding unit 10 with two rows of siding. Nevertheless, it should be understood that a paneling unit of the present invention may be manufactured with any desired number of rows.

**[0024]** In Figures 1 and 2, the siding unit 10 includes backing portion 20 and at least one facing or cover panel or portion 30. For example, the backing portion 20 may be comprised of a base of either expanded or extruded polystyrene foam. However, it should be recognized that the backing portion 20 may be comprised of any sufficiently rigid material, including, but not limited to, foam, fiberglass, cardboard, and other similar, suitable, or conventional materials. Any suitable means may be used to obtain the shape of the backing portion 20. In an exemplary embodiment, the shape of the backing portion 20 may be obtained by extrusion through a predetermined die configuration and/or by cutting such as with a power saw or other cutting devices.

**[0025]** The backing portion 20 may be glued or otherwise laminated to the inside of the cover panel 30. For example, an adhesive may be used to bond a portion of a backed portion 20 to a portion of the inside of a facing panel 30.

**[0026]** In addition, the facing portion 30 may include an attachment strip 32 (e.g., a nailing strip), a tongue 34, and a groove 36. The facing panel 30 of the present invention has a portion 35 that rearwardly extends to attachment strip 32. The portion 35, alone or in combination with attachment strip 32, substantially covers the end or tip

of the backing portion **20**. More particularly, the portion **35** wraps around and abuts or is substantially adjacent to the end or tip of the backing portion **20**. As a result, the portion **35** protects the end or tip of the backing portion **20** from damage, particularly during shipping and installation. In this example, the attachment strip **32** is substantially in the same plane and parallel to an adjacent portion of the rear side of the backing portion **20**. A channel **37** on the bottom portion of the backing portion **20** may be adapted to interlock with, overlap, and/or extend over the nailing strip **32** of the facing panel **30** of a substantially similar siding unit **10**. The nailing strip (also called a nailing hem) **32** may have a plurality of openings for receiving fasteners. Nails or any other suitable mechanical fastening means may be extended through apertures in the nailing strip **32** in order to secure the facing panel **30** to a building structure. As is shown in Figure 1, the tongue **34** is adapted to fit in the groove **36** of another siding panel when installed on a building structure. Likewise, the groove **36** is adapted to receive the tongue **34** of a substantially similar siding panel when installed on a building structure. The tongue-and-groove connection may also be referred to as a hanger section.

**[0027]** The top or face portion of the siding unit **10** may have a facing panel **30**, which completely covers the backing portion **20**. A benefit of this feature is that the backing portion **20** is protected from breakage that may occur in shipping, handling, or installation if not substantially covered with a facing panel **30**.

**[0028]** Figure 3 shows an embodiment of a siding unit **40** in which the backing portion **50** extends into the groove **66**. The tongue **64** is adapted to fit into the groove **66** of an adjacent siding unit. The unit also has a nailing hem **62**, which may or may not

have an aperture for fastening the siding unit down. A channel **67** on the bottom portion of the backing portion **50** is adapted to interlock with, overlap, and/or cover the nailing strip **62** of the facing panel **60** of a substantially similar siding unit **40**.

**[0029]** In Figures **3** through **6**, the facing panels **60**, **100**, **140**, and **180**, respectively, have flat top surfaces that are substantially parallel to the structure on which the paneling unit is adapted to be installed. In these examples, the facing panels have regularly space indentures or recessed portions **70**, **110**, **150**, and **190**, respectively.

**[0030]** Figure **4** shows an embodiment of the present invention. The siding unit **80** has a backing portion **90** and a facing panel **100**. The facing panel **100** includes an attachment strip or hem **102**, a tongue **104**, and a groove **106**. In this embodiment, the facing panel **100** substantially covers the top end or tip and the bottom end or tip of the backing portion **90**. The tongue **104** extends around and abuts or is substantially adjacent to the top end or tip of the backing portion **90**. Also, the groove **106** wraps around and abuts or is substantially adjacent to the bottom end or tip of the backing portion **90**. A terminal portion of the groove **106** extends away from a channel **107** on the rear side of the bottom portion of the backing portion **90**. The channel **107** may be adapted to interlock with, overlap, and/or extend over the nailing strip **102** of the facing panel **100** of a substantially similar siding unit **80**. The channel **107** may provide a sufficient amount of clearance for the top of a mechanical fastener such as a nail, which may extend through the nailing strip **102** of an adjacent siding unit **80**.

**[0031]** Figure 5 represents an exemplary embodiment of a wall panel unit **120** of the present invention. The paneling unit **120** has a backing portion **130** and a facing panel **140**. The facing panel **140** includes an attachment strip or hem **142**, a tongue **144**, and a groove **146**. This embodiment of the facing panel **140** also substantially covers the top end or tip and the bottom end or tip of the backing portion **130**. In this example, the tongue **144** extends around and abuts or is substantially adjacent to the bottom end or tip of the backing portion **130**, and the groove **146** wraps around and abuts or is substantially adjacent to the top end or tip of the backing portion **130**. A terminal portion of the facing panel **140** may extend around the bottom end or tip of the backing portion **130** and into a channel on the rear side of the bottom portion of the backing portion **130**. The channel may be adapted to interlock with, overlap, and/or extend over the nailing strip **142** of the facing panel **140** of a substantially similar paneling unit **120**. The channel may provide a sufficient amount of clearance for the top of a mechanical fastener such as a nail, which may extend through the nailing strip **142** of an adjacent paneling unit **120**.

**[0032]** Figure 6 shows an embodiment of a paneling unit **160** of the present invention. The paneling unit **160** has a backing portion **170** and a facing panel **180**. The facing panel **180** includes an attachment strip or hem **182**, a groove **184**, a tongue **185**, and another tongue **186**. This is another embodiment in which the facing panel **180** substantially covers the top end or tip and the bottom end or tip of the backing portion **170**. In this example, the groove **184** is formed between the nailing strip **182** and the tongue **185**. Both the groove **184** and the tongue **185** abut or are substantially

adjacent to the top end or tip of the backing portion **170**. On the other hand, the tongue **186** extends around and abuts or is substantially adjacent to the bottom end or tip of the backing portion **170**. As shown in the example, a channel may be formed on the rear side of the bottom portion of the backing portion **170**. The channel may be adapted to interlock with, overlap, and/or extend over the nailing strip **182** of the facing panel **180** of a substantially similar paneling unit **160**. The channel may provide a sufficient amount of clearance for the top of a mechanical fastener such as a nail, which may extend through the nailing strip **182** of an adjacent paneling unit **160**. Optionally, the facing panel **180** may extend around the bottom end or tip of the backing portion **130** and into the channel.

**[0033]** The paneling unit of Figure **6** is adapted to be connected to adjacent, substantially similar paneling units as shown in Figure **7**. A designated portion of Figure **7** is shown in Figure **8**. The tongue **186** of one paneling unit is situated in the groove **184** of an adjacent paneling unit. A fastener **183** is shown in an aperture of the nailing strip or hem **182**.

**[0034]** Figures **9** through **11** illustrate some other embodiments of paneling units of the present invention that include some or all of the aforementioned features. Figure **9** shows a wall panel unit **200** that is comprised of a facing panel **210** and a backing portion **220**. Figure **10** shows a fastener **230** connecting adjacent paneling units **200** together. A wall panel unit **240** comprising a facing panel **250** is shown in Figure **11**. It should be recognized that the wall panel unit **240** may include a backing portion.

However, it should also be recognized that some embodiments of paneling units of the present invention may not include a backing portion.

**[0035]** Figure 12 is a rear elevational view of an exemplary embodiment of a paneling unit of the present invention. As may be observed in Figure 12, a backing portion 310 of a paneling unit 300 is shown wherein the backing portion is comprised of a bottom portion defining a channel 320; a plurality of drainage grooves 330 on a surface 350 of the backing portion 310; and a pair of connector grooves 340 on the surface 350 of the backing portion 310. As shown, the generally horizontal connector grooves 340 intersect the plurality of drainage grooves 330. As is typical for an installed position of a paneling unit of the present invention, the paneling unit would be approximately vertical. As a result, the drainage grooves 330 as shown in this exemplary embodiment would be angled downward and thusly provide a drainage pathway for a liquid such as water, or an accumulation of water such as might be produced from condensation. As can be noted from the position of the generally horizontal connector grooves 340, the intersection of the connector grooves 340 with the drainage grooves 330 provides an alternate pathway for a liquid to drain. As a result, if a particular drainage groove 330 were plugged or obstructed, excess liquid may be diverted to drain through another drainage groove 330 by its transfer via an intersecting connector groove 340.

**[0036]** As shown in Figure 12, and with even greater detail in Figure 13, an exemplary embodiment of a paneling unit of the present invention may have a plurality of drainage grooves 330 oriented at an angle of approximately 30° from vertical with

respect to the longitudinal length of the drainage groove **330**. Alternatively, the drainage grooves of other embodiments of the present invention may be placed at other angles on the surface of the backing portion. Preferred embodiments will typically have drainage grooves on the surface of the backing portion of the paneling unit in a generally downward trend so as to facilitate the drainage of liquid. Other alternative embodiments of the present invention may use drainage grooves that intersect other drainage grooves. In addition, alternative embodiments of the present invention may use patterns of drainage grooves not necessarily defined by straight lines that facilitate the drainage of liquid.

**[0037]** With regard to the connector grooves **340** as shown in Figures **12** and **13**, the connector grooves are shown as being in a generally horizontal orientation. Alternative embodiments of the present invention allow for connector grooves to be generally oriented in any direction. It is preferred that at least one connector groove intersects at least two drainage grooves on a surface of a backing portion of a paneling unit. Generally, the relationship between a plurality of drainage grooves and at least one connector groove on a surface of a backing portion of a paneling unit is that the grooves are hydraulically connected.

**[0038]** Figure **14** is a side elevational view of an exemplary embodiment of a paneling unit of the present invention. This view of a preferred embodiment of the present invention shows a pair of generally horizontal connector grooves **340** on a surface **350** of a backing portion **310** of the paneling unit **300**.

**[0039]** Figure 15 is a side elevational view of a portion of an exemplary embodiment of a paneling unit of the present invention. Particularly, this view of an embodiment of the present invention is intended to show example dimensions and a shape for the connector grooves and the drainage grooves of the present invention. As shown, either type of groove is generally a curved groove having a depth of 0.0625 inches deep and 0.1875 inches wide into a surface of the backing portion of a panel. These dimensions may vary as needed. Typically, a groove would not be placed deep enough to penetrate the entire backing portion of a paneling unit. Instead, the generally preferred embodiment of the grooves of the present invention will be sized and placed so as to adequately allow a liquid to drain from the surface of the backing portion of the paneling unit.

**[0040]** The top or face portion of the paneling units may be smooth or may have any number of finishes that are typically known by those in the art of manufacturing paneling. The finish may add contour and texture to simulate the appearance of wooden paneling.

**[0041]** The paneling units of the present invention may be of various lengths, heights, and thicknesses. The particular dimensions of a panel of the present invention may be selected to suit a particular application. Some exemplary embodiments of a paneling unit of the present invention may be approximately 15 to 18 inches in height. However, as just mentioned, it should also be recognized that a paneling unit of the present invention may have any desired dimensions including a height up to or in excess of 50 inches.

**[0042]** The paneling units as described herein may be formed from a polymer such as a vinyl material. Other materials such as polypropylene, polyethylene, other plastics and polymers, polymer composites (such as polymer reinforced with fibers or other particles of glass, graphite, wood, flax, other cellulosic materials, or other inorganic or organic materials), metals (such as aluminum or polymer coated metal), or other similar or suitable materials may also be used. The paneling may be molded, extruded, roll-formed from a flat sheet, or formed by any other suitable manufacturing technique.

**[0043]** Any embodiment of the present invention may include any of the optional or preferred features of the other embodiments of the present invention. The exemplary embodiments herein disclosed are not intended to be exhaustive or to unnecessarily limit the scope of the invention. The exemplary embodiments were chosen and described in order to explain the principles of the present invention so that others skilled in the art may practice the invention. Having shown and described exemplary embodiments of the present invention, those skilled in the art will realize that many variations and modifications may be made to affect the described invention. Many of those variations and modifications will provide the same result and fall within the spirit of the claimed invention. It is the intention, therefore, to limit the invention only as indicated by the scope of the claims.
